The Future of Education

Marcus Grandon

Traditional education as we know it is the middle of great change. While changes do occur constantly in the realm of education, it seems that the current tidal wave of change is such that it will raise the bar for what is known as standard educational practices. This shift will come about largely by the way that the Internet is employed in various curricula especially at the university level. At this point, the potential for using the Internet as a means to a university education has gone largely untapped. How will this potential be unlocked? One way is that universities will create entire degree programs at all levels. Other shifts that will occur in the education of the future will be the role of the teacher and how students are accessed. This change will come about when teachers better understand the psychology of learning.
